

01 / 05 **DELIVERABLE** · **KNOWLEDGE FOUNDATION**

Knowledge Foundation Blueprint

A single, shared home for everything an analyst needs to know — instead of it living in six people's heads and a scatter of files.

Status v1 · scaffold ready to copy to Drive Owner Chii / Chiibitsu Labs

Why this exists

Ask two analysts what "good" looks like for the same client and today you'll get two answers — not because anyone's careless, but because the standard was never written down anywhere both of them could read it. New context gets re-explained every engagement. A person leaving takes the knowledge with them. That's the root cause this deliverable fixes: not a training problem, a *storage* problem.

What it is

A plain-markdown folder, `amplifi-knowledge/`, living in the shared Drive everyone already uses — readable and editable by hand, no new software to learn. It separates two things that are easy to blur together:

The vault

The actual knowledge — client briefs, brand standards, what "good" looks like, the lessons log. This is Amplifi's, permanently, regardless of which AI tool reads it next year.

The lens

Whatever AI skill or tool reads the vault today. Tools change; the vault doesn't have to. Swap the lens without losing the knowledge underneath it.

How it's organized

FOLDER	HOLDS
clients/[client]/	Living brief, brand standard, context notes, insight log, delivery log — one set per client, seeded from a template.
standards/	What good looks like, house voice, report-template rules — the encoded definition of quality, shared across every client.
learnings/	Patterns spotted across sessions and clients, plus the router-decision log — the corpus's own memory of itself.

Five decisions worth knowing about

1. **Living briefs, not static onboarding docs.** A client brief updates as the relationship evolves — it's never "finished."
2. **The insight log compounds.** Every delivered report adds a dated entry; next period's analysis reads the whole history, not just this cycle.
3. **The delivery log feeds the instrument.** Cycle time, on-cadence rate, and rework rounds are captured as a byproduct of shipping — not a separate tracking chore. This is also Deliverable 5's second data feed.
4. **The brand standard is the anti-slop layer.** It's the one file that makes AI output actually sound like Amplifi instead of generic AI.
5. **One home, shared access.** All six people on the function get edit access to the same folder — no person-locked knowledge.

The capture loop

How the vault gets smarter instead of going stale:

1 · SESSION ENDS Run the capture skill — what worked, what didn't, what should be remembered.	2 · LEARNINGS/ Raw notes land in the corpus's own memory folder, dated and attributed.	3 · WEEKLY PROMOTION Every Friday, real patterns get promoted into the operative standards files.	4 · NEXT SESSION Already knows it — no one has to re-explain the same lesson twice.
---	--	---	---

Migration path

Lives in Google Drive today, because that's what the team already has open. The day the CTO clears GitHub access for Claude Enterprise, it's a documented copy-paste to git — nothing about the structure changes, just where it's hosted.

What it must not become

Not a second inbox. Not a wiki nobody maintains. Not a place where "we'll document it later" quietly means never. The capture loop above exists specifically so the vault stays a byproduct of real work, not an extra job.

Chiibitsu Labs — more human, by design.
