

The Knowledge Foundation

The vision comes first. This is the middle step it earns — the real workflow, organized, in one shared home the whole analyst function reads from.

Status Live — on your team's shared Drive Built by The analysts, live in the room

You already named this

The intake asked what single thing, written down, would save the most rework. The answer was clear:

A knowledge base across the analyst role — from client pitch to regular insights reporting.

MICHELE CURRAN, COO — INC SPRINT INTAKE

Right now that knowledge lives across "Canva, Claude, and the respective laptops of the analysts." Scattered, person-locked, re-explained every engagement. This deliverable is exactly the thing the intake named — now built, and sitting in one place your whole team can read.

Vision first. Then the workflow. Then the tools.

The vision comes first — not which tools to use, but the transformation you actually want. Ask that without any constraints, and the real question gets sharp fast: what would this look like if it actually worked?

That question is what earns everything after it. Once the vision was clear, the sprint went deep on the real workflow — where it actually breaks, and getting it organized. The team practiced that organized workflow themselves next, AI already in hand as a partner, before the AI implementation itself got built out. Implementation comes last, on purpose: by the time it's built, the vision is set and the team already knows the workflow cold, so the AI has something real to work with instead of a guess.

This foundation is that middle step, done: the workflow, organized, in one place.

How to think about it

AI is the librarian. You are the curators.

The team owns and contributes the knowledge. The AI files it, keeps it tidy, and fetches it on demand. The knowing is human; the upkeep is the AI's job — not another manual chore.

Build just in time, not the cathedral.

No big documentation project that stalls on day two. The foundation grows a little every time someone does real work, so it stays alive instead of becoming a thing to "finish later."

It's yours.

This knowledge belongs to Amplifi, permanently — not Chiibitsu's, not the tool's. Whichever AI reads it next year, the vault doesn't move and you don't lose it.

Structure came from you.

The folders and the shape weren't handed down. You organized your own foundation, live in the room, around how the work actually flows.

It maintains itself as you work

The foundation gets smarter as a byproduct of the work, not as a separate task on someone's list. The team committed to growing it with their function — and amplifi-improve does the filing.

1 · DO THE WORK

A report ships, a client preference surfaces, a correction lands.

2 · AMPLIFI-IMPROVE CAPTURES IT

The skill logs what was learned into the foundation, dated and in place.

3 · NEXT TIME, IT KNOWS

The lesson is already there. No one re-explains the same thing twice.

Where it goes next

The foundation is on Google Drive today, because that's what you already have open. It matures from there — same knowledge, better home each step.

Now — Google Drive

Live, shared, editable by hand.
Zero new software to learn.

Next — GitHub

Versioned history and clean team-wide access, once the integration is enabled.

Later — Obsidian, org-wide

A linked knowledge graph the whole organization reads from, not just the analyst function.

What it must not become

Not a second inbox. Not a wiki nobody maintains. Not a place where "we'll document it later" quietly turns into never. The just-in-time habit and the AI doing the upkeep are the guardrails against all three.

Take amplifi-improve with you. The same skill that captures for the knowledge base is what closes the loop on Deliverable 2 — one skill, installed once, filing for both. See how it works →

Chiibitsu Labs — more human, by design.
